| <p>My research focuses on the ecology of birds, with particular emphasis on forest species. The main areas of interest include breeding biology, reproductive strategies, habitat selection, and population dynamics of birds. An important line of research also concerns the impact of environmental changes, including forest management and landscape transformations, on the structure and functioning of bird communities.</p> <p>I am also interested in broadly understood forest biology, including the importance of dead trees, the formation of microhabitats, and their use by animals. The main study area of my research is the Białowieża Forest.</p> <p>Both classical field methods and modern research techniques are applied, including nest monitoring, behavioral observations, bird marking (ringing), spatial analyses, and statistical methods used to assess ecological relationships and population trends.</p>                                                                |
